

New Hampshire Hydrography Dataset: Fourth Order and Higher Streams
Document Overview
January, 2008

This document contains a summary of fourth order and higher streams in New Hampshire, based on the 1:24,000-Scale New Hampshire Hydrography Dataset (NHHD). The NHHD is archived in the GRANIT database at Complex Systems Research Center, University of New Hampshire.

Description of worksheets in this document:

Summary by GNIS Name:

Summarizes stream length by GNIS name (Geographic Names Information System, from the U.S. Geological Survey). Please note that multiple streams across the state may have the same name. In these cases, the GNIS ID uniquely identifies individual streams. Stream length totals are therefore based on GNIS ID. Additionally, there are occurrences where streams did not receive a GNIS name. These streams could not be uniquely identified, and therefore were summarized as a group (Unnamed Stream/River).

Summary by Stream Order:

Summarizes stream length by stream order.

Summary by Town Name:

Summarizes stream length by town name.

Process Steps:

Describes GIS process used to extract data required to generate these summaries.

**New Hampshire Hydrography Dataset: Fourth Order and Higher Streams
Summary by Geographic Names Information System (GNIS) Name
January, 2008**

| GNIS* ID | GNIS* Name | Stream Order | Town Name | Stream Length (ft) |

*Geographic Names Information System (U.S. Geological Survey)

New Hampshire Hydrography Dataset: Fourth Order and Higher Streams
GIS Process Steps
January, 2008

1. Clipped the statewide streams layer to the state boundary to create shapefile *NHDFlowlineClip*.
2. Extracted streams coded with a stream order of four or higher and exported to new shapefile *NHDFlowlineClip_4th_higher* (7301 of 68890 features extracted).
3. Used Identity tool to assign town names from the statewide political boundaries layer to *NHDFlowlineClip_4th_higher*, creating new shapefile *NHDFlowlineClip_4th_higher_towns*.
4. Added a new field, *StreamLeng*, and used calculate geometry function to generate stream lengths.
5. Used Frequency tool to generate a table (*NHDFlowlineClip_4th_higher_Frq.dbf*) containing GNIS ID, GNIS Name, Stream Order, and Town Name. Summarized on Stream Length.
6. Saved DBF table as MS Excel file (*4th_order_higher_summary.xls*), formatted for readability and generated stream length subtotals.
